Subject: Factor for Heskett unit 2

The factor to be applied to Heskett2's baseyear annual emissions for estimating 24 hour average emission rates is 1.83. This unit apparently is used for peaking with a large variation between daily average and peak day emissions. The number is derived from 1999 and 2000 annual average emissions of 1993 tons per year, divided into the 90th percentile emission rate of 3641 tons per year.
